A Simpler and faster way of messaging by [Avena Sowell](#)

Article published on June 26th 2012 | [Communication](#)

Text messaging is one of the most important elements in bulk text messaging. It is used by different operators or networks to send text to different receiver at one time at a low cost. The companies are coming up with modern, new and varieties of software to facilitate the process mass sms and improve the communication between the customer and the server. This is boosting the profit and making them more and more cost effective. Marketing is helping a great deal in popularizing the concept of bulk sms and thus the speed is also getting increased. The various kinds of sms softwares are web based application, desktop application, email application and application programming interface.

Desktop application is one of the easiest ways to receive or send text message from Windows. A message can be sent from the desktop by connecting to the internet directly to the receiver's mobile phone. This application helps to avoid logging into the account every time a text message is needed to be sent. Once the text messaging provider has been selected then only can web application or desktop application or email based application can be selected. Through the text messaging gateway, a text message is delivered to several carriers having different communication protocol. Sms gateway is a network facility which is used to receive or send text. It simplifies the process of communication via sms and is used by sms application developers who in order to send text message or receive it connects to sms centers of various wireless carriers. During sending of bulk message many problems are faced and this problem is solved by placing a sms gateway in between two sms centres. These sms gateway receive the message from the software application and translates it to the protocol of receiver's carrier.

API as known as application programming interface is used by various components of software to interact with each other. An API includes data structures, variables, object classes, etc. It can be language independent or language dependent. There are ranges of APIs that make the business applications sms enable and are cost effective. The APIs can be easily integrated, connected easily to a sms gateway, can provide delivery tracking to handset, web push for real time delivery of inbound sms, etc.

Thorough this bulk sms software, messages of varied content can be sent to different numbers. It is more cost effective; more software is being found daily to increase the rate of bulk sms. They help the companies to reach out to the customers on a large scale basis. Bulk sms helps in the interaction with the customers and the prospects. It helps to approach the target market even more by delivery reports, low cost, maximum reach, automatic response, notifications, a contact list, import of contact list from excel files, etc.

There are various softwares in the market, all aiming to make it easy for the customer to interact with the server. Such softwares offer various kinds of message sending techniques and once the software is downloaded, it becomes a stand alone application.
