A Closer Look at the Procedure Called Laser Hair Removal by [Tobi Fistcher](#)

Article published on June 7th 2012 | [Business](#)

Most likely, the greatest misconception concerning laser hair removal procedures is that after a treatment, your hair will never grow again. To continue to be hair-free, laser hair removal patients may have to return for an additional session-usually after a year.

Laser hair removal works via selective photothermolysis. During the operation, the laser ruins the melanin, the dark matter around the follicle. The follicle is the area of the skin that grows the hair. Laser is directed to the follicle and does not impact the remaining skin, so it's unusual to feel virtually any pain during the treatment.

The cause of hair regrowth is not the ineffectiveness of the operation but the fact that hair is growing in cycles. The damaged hair follicles and melanin heal and hair roots reestablish themselves. At any given time, about 80% of your hair develops, 10% begins to grow, and the remaining 10% sheds. This hair cycle calls for patients to undergo around three to four follow-up treatments before all the hair in the problem area ceases developing. These succeeding treatments are based on the specialist according to hair regrowth on your subsequent visit.

Chemotherapy is an instance of a treatment where hair loss and hair growth can occur to a patient. When a person undergoes chemotherapy, his/her hair falls out since the treatment kills the cells that induce hair growth. But when the chemotherapy cycle is carried out, hair may begin to grow again over time or not depending on the dose of chemotherapy administered.

Both men and women can get any laser hair removal operation done, but ladies account for most of the laser hair removal patients. This is usually done on areas of the body that a patient no longer prefers to perennially shave like the abdomen, bikini line, legs, chest, arms, upper lip, and underarms. Los Angeles laser hair removal specialists confirm that the most challenging areas to treat are the legs, back and face since hair is heavy in these areas.

Laser hair removal is the most effective solution for hair growth problems. After a number of therapies, the hair development cycle eventually slows down until such a time when you do not need as many therapies for the laser hair removal Los Angeles has to offer.

If you're finding a specialist in laser hair removal in Los Angeles, you can try visiting online databases. Such sites also show rates for numerous laser hair removal treatments for your reference.
