Coffee needs care by [Dion Sivla](#)

Article published on March 9th 2012 | [Business](#)

The people have realized the importance of coffee. They have really learned that every sip of the coffee is not just as easy as it seems, every sip is to be earned. And there is nothing wrong even when we say in a laymen language, as coffee is high costing so respecting it along with the care is but natural.

The coffee manufacturing actually begins from the plant. The fresh seeds of coffee is collected and then processed so that the coffee beans become slight resistant towards the microbial attack and also humidity ratio gets lower. These processed or roasted beans are then moved further on to the packaging department where actually the major role is to be played. The roasted beans actually release carbon dioxide for the maximum time, and if they are packed as it is, then it will be even dangerous. For this purpose, the one way degassing valve was used which allows the fresh air to enter in, along with the removal of unwanted and harmful gases. But, the problem does not end here only.

There are chances that the coffee packet may get punched due to any mechanical error or excessive pressure or any other way. This may also lead to the loss and degradation of the fresh coffee. This is the reason that the strong specially made coffee bags are used for the proper and safe packaging of the coffee. These coffee bags are either made of foils, which are very thick and strong, or polymer based product which are also equally strong and efficient. These bags are specially made for the purpose of packaging of coffee only. These days, the coffee is also found to be packed inside the stand up pouches. These pouches are occupying less space and also very attractive but equally very safe and resistant.

The coffee plants are available in various species and every species has its own specialty, taste, aroma and quality. These are certain species of plants whose beans are found to release the carbon dioxide even after passing through all the necessary steps of packaging. Looking at this, a very essential invention was made by creating the stand up pouches with valves. Such valves not only helped in keeping such beans safe, but also maintained the required environment inside the pouch. All such new inventions are taken for the sake of the consumer requirement and better living; we must encourage such efforts and welcome all the new inventions with open arms.
