Expenses and Advantages Associated with Rail Construction by [Chris Adam](#)

Article published on April 9th 2012 | [Business](#)

In the past few years, various cities across the world have become highly populated which leads to paucity of space. and buses have become too congested. This has made travelling in them also difficult for the common people. Thus light rail has become a major form of transport for the common people. This can be a source of economic development for the city if the stations are placed strategically at certain points where the presence of people is a surety. Thus light rail construction is really inevitable for the highly populous cities.

The light rail construction has various benefits adhered with it. It will help to lessen traffic jamming and pollution drastically. With lesser number of cars plying through the road, traffic will be more flexible. Also, the less automobile exhaust will minimize the pollution. If toll-tax can be implemented as well as gas tax, then people will take more into the rails. The value of property surrounding the stations will increase and thus will help in financial expansion.

This is because communication to any other part of the city is quite simple. Economic development from light rail construction occurs with the expense of some money. The fare for such mode of transport is less and thus will be an effective mode of transport for the poor.

Most light-rail systems obtain central financial support that is spent on the large portion of the rail construction costs. Whatever is left as a part of expenditure is paid by earmarked tax revenues or bond issues-paid by future tax revenues. When we think of the cost related to the operation, we think that the major part of the cost is borne by the revenue accumulated from the fare. It's actually the money earned by the centre from the tax paid by the common men throughout the year. Thus even if the money needed to start rail construction may be too much, the benefits about the light rail is unmatched.
