Growing Need & Demand of Computers by [Ariel Linford]

Article published on August 2nd 2012 | [Computer]

A computer is a general purpose device which can be programmed to carry out a finite set of arithmetic or logical operations. There can be no denial about the ever increasing needs of computers in every kind of work we do and every place we go. The computer technology has become crucial necessity of life for us. Whether we are working in our office or trying to relax at home we need a computer to help us out in whatever we do. It is not just what we prefer; today a computer is more than a necessary option that we always choose to work with. However, computer expenses become a big question when it comes to solving problems through computing.

Itâ€™s a fact that worldâ€™s biggest banks and multinational companies are out of recession era but we common men are not. We are still lagging behind in that era, still trying to drag ourselves out of it. Many of us lost jobs and are in search of new ones. Then why not begin with a little but very important and profitable investment. Letâ€™s help ourselves out by buying cheap computers to manage our utmost requirement.

The need of cheap computers is increasing day by day. You may want to give a boost to your business by increasing the work efficiency through the increase in the number of cheap used computers at your work place but are not in a position of a big investment. Or you may have a personal computer at your home but your children or younger siblings are growing up and with them their computer needs are increasing also which makes it no more possible for you to share your PC with them any longer because they seem to share it with you at expense of your time of using computer or because you cannot risk your document laden computer with all important files in it into their hands.

For decades, desktop computers have ruled the roost when it came to power, storage and capability. The only way you could get the most out of games, doing heavy graphics work and massive number crunching was to have some type of desktop computer system. Due to heat constraints, and size limitations, laptops had slower processors, less hard drive space and less memory even though they were considerably more expensive. But with advances in technology, better heat distribution and fast low power processors, desktops just aren't as relevant as they used to be.

Unquestionably, laptop computers are far more portable enabling users to take their computer with them virtually anywhere they go. Many schools, hotels, restaurants and areas such as public parks and airports have Wi-Fi connections for their customers and visitors which mean that anyone with a laptop or even a smart phone can get online. Also, laptop computers today have multi-core processors, have several gigabytes of RAM and have huge hard drives.

Unfortunately, desktops still have the ability to do things that simply can't be done with a laptop. Desktops have slots designed to handle expansion cards to add functionality such as fire-wire cards, additional USB ports, RAID controllers and multiple graphics cards by simply opening the case and popping in the card. Upgrades for desktops are much easier as well since you can easily open the case to swap out components such as replacing smaller RAM modules with larger ones and adding hard drives.

The best computers are here because of technology. Technology is the best thing ever invented. Primarily, technology was invented to lessen the workload of human. Technology is to machines and vice versa. Anything that reduces human effort is a machine. It is very useful and functional because our tasks becomes lighter and easier. Most machines nowadays are run by the computer.

Programs are selected to a specific task or tasks. It can obey a single or couple of commands and the machines will be the one to do the job. It is still operated by humans; only machines do it for us.

Computers are designed to be tough, can take multiple commands, and carry out maximum and quality performance. Computers can form multiple tasks in a span of a little time. Computers at home during the early times can only do typing commands. Computers at home, become better. It already has programs for home and office use.

When planning to buy one, you must choose the best, efficient and quality computers available in the market. You must set guidelines according to your preferences. Some like small screens and others prefer the large, high definition desktop screens. Companies like Intel, Aspire, Compact and Acer have the best computers available on the market today. The more expensive unit does not mean it works better than the cheaper one. It still depends on your purpose. And lastly, think about the specs of the computer system.
