Learning About Cosmetic and Reconstructive Plastic Surgery by Comerford

Article published on March 12th 2012 | Health

For over 2700 years, the medical specialty of plastic surgery has already been practiced. The repair of the human body's form and function is the top concern of this specialty. The most ancient documented operations were performed in India by 800 BC which, a few hundred years later, played a role in the upsurge of the plastic and cataract surgery. Nowadays, plastic surgery has advanced into one of the leading medical branches addressing various body problems, avoiding probable disorders, and enhancing physical appearance.

The two sectors of plastic surgery are reconstructive and cosmetic. Reconstructive surgery is differentiated from cosmetic plastic surgery by its emphasis on the correction of functional impairment, improving appearance and hindering possible problems from occurring. Cosmetic plastic surgery, meanwhile, is more physical enhancement. It is also used to preserve a physical appearance or to repair it when affected by climatic elements.

Reconstructive plastic surgery usually handles hereditary problems and burns, along traumatic injuries like facial bone fissures. The most prevalent procedures categorized as reconstructive include scar repair, breast reduction, and tumor removal. Plastic surgeons in huge states like Arizona execute various methods in moving tissue from one part of the body to another. In some cases, tissues from another source are utilized, a technique called allografting. Tissues taken from another species, though, are called xenografts.

Cosmetic plastic surgery is practiced in a greater scale in different parts of the globe. In the US alone, around a million treatments are added to the total number of procedures conducted yearly. The five most common cosmetic surgeries are liposuction, breast augmentation, eyelid surgery, nasal surgery, and abdominoplasty. These operations are conducted in numerous countries, including France, the United Kingdom, and Germany. Cosmetic plastic surgery Arizona surgeons conduct comprises more than half of the overall plastic surgeries done in clinics and offices.

Liposuction and breast augmentation are the most popular cosmetic plastic surgeries. They apply opposite processes in that breast augmentation guarantees any safe technique to better the form, size, and feel of the breast, while liposuction decreases the form and size of a particular area of the body by removing the fat. An Arizona plastic surgeon also integrates liposuction in other operations such as abdominoplasty.

Going through any procedure obligates a patient to undergo three stages: pre-operative, actual operation, and post-operative. In plastic surgeon Arizona features doctors who dutifully informs patients with the advantages and hazards of the procedure and gives instruction to hasten recovery during the post-operative phase.
