A flat roof is a form of structure covering that has no slope. The horizontal structure of a flat roof erases the need for complicated trussing and decking. Unlike a common pitched or gable-type roofing, flat roofing ordinarily lies only on two intersecting beams that prevent the membrane from sagging.

With the aid of a particularly slight incline, water that has collected on the surface of the roof is capable of streaming in the direction of the drainage. If there is no slope, it is most certain that water will pool or gather in sagging parts, inevitably bringing about damage of the substrate if openings allow the water to leak through. Moreover, furnishing at least a little slope will speed up the drying of the roof following the rain, which can stop the growth of algae and other harmful microbes.

Regardless of type, the waterproofing material placed on flat roofing is called a membrane. Determined by the type of membrane utilized, the water running on its surface may be carried by the gutter system toward an exclusively created soakaway for upcoming use. For instance, many flat roofs acquire water in a pool because of aesthetic reasons or for rainwater cushioning.

Flat roofs are typical in areas where there is usually a smaller amount of precipitation and where timber is not immediately available for building decks and trusses. Concrete flat roofs are common in locations with warm weather as something to prevent heat from entering. However, structures with flat roofs also are present in cold regions, such as Toronto, Canada. Aside from concrete slab, flat roofing in Toronto can be composed of an aliphatic compound, Ethylene propylene diene monomer (EPDM), vinyl membrane, or bitumen. The dissimilarities in properties of these roofing materials makes solutions like building and flat roof repair Toronto builders provide also diverse.

The regular life span of a flat roof is 10 years and hinges enormously on routine maintenance. Flat roofs that are composed of tar, paper, and gravel can stay intact for 20 to 30 years with slight roof repairs Toronto homeowners can do by themselves. While in heavy rain, homeowners must clear away ponds of water within 48 hours to prolong the life of the flat roof.
