Fundamentals of Lighting Styles by [Lightingstyles](#)

Article published on January 20th 2012 | [Home Improvement](#)

Lighting is to use artificial light sources such as lamps and lighting fixtures, natural lighting, and capturing the light of day. Day lighting system (windows, skylights, shelves, or light) is often used as the main source of light during the day in buildings. This saves energy compared to artificial light, which is an important part of energy consumption in buildings. Without proper planning, the energy can be wasted by using too much light, or by obsolete technology. Proper lighting can improve the performance of activities, improve the appearance of the area, and have a positive psychological impact on residents. One of the fundamental doctrines of proper lighting is the illumination and necessary in many applications, such as projection screens, LCD back lights, lamps, microscopy, solid state lighting and general lighting. Interior lighting is generally achieved by using artificial lighting, and is a key part of the interior.
