Probably the most important things to take into account when looking at windows storage server is hardware cost. Today, iscsi is becoming the most well-liked selection for fast performance at a reasonable price. The use of other hardware technologies that run on different platforms may result in a significantly higher cost. That can be a problem if the amount of storage needed across the entire enterprise is big.

The use of commodity hardware including iscsi, hard drives, and enclosures is exactly what keeps the cost quite reasonable. Additionally, it allows the same amount of money to be able to buy more data storage space. That means management and administrators don't have to be worried about not having enough space since the budget didn't permit enough storage.

Data Protection

Probably the most important duties of the windows storage server is data protection. There are two goals. First of all, you need to ensure that just the right type of authorized data is capable of being put on the machine. The program is what makes sure that just the right stuff is stored on the storage server.

The other thing that's extremely important would be to make certain no data is lost, even when one or more hard drives fail. The program will notify system administrators when a hard drive has failed. One hard disk failure will not cause data loss. So long as the hard drive is replaced with a completely functional one when needed, there must be a minimal chance of data loss from hardware failure.

Distributed Access

One great feature of a windows storage server is distributed access to data. That means it's possible for anyone on the LAN or perhaps a WAN to access the data. Which makes collaboration much easier because it is going to be quite simple to share files and directories.

Another great feature associated with access is it does not matter what platform the other users are on. There are multiple protocols sustained by the storage server to make certain that users on other kinds of system can access exactly the same data also. This is exactly why this storage server can be a great choice even in a heterogeneous environment.

Who

Many companies can benefit greatly from windows storage server. It's not technology that's only for the 500 biggest corporations in the country. It's something that is reasonable priced as well as useful for typical smaller businesses as well. Remember that commodity hardware has created these storage solutions a lot cheaper and much more accessible.

The small business can save a lot of time and money by choosing this solution. If your storage server is created from scratch, it will take a lot of time and effort to make it work. That time could be used more productively in other parts of the business instead. Of course, it's possible to start small on the storage server and then grow it as the amount of data and business grows.
