The reputation of Gateway computer has been to manufacture laptops with just the right configuration without any major disaster. They have lived up to their reputation for producing another Laptop with the right configuration and without any major problems. You should not expect much from the Laptop as it is the right Laptop with the right configuration.

Configuration

Performance and Battery Life

Input and Output

Appearance

The 15-inch Laptop is thin and slim in comparison to the other available Laptops in the market. The Laptop is compact and is well made of plastic body. The keyboard for example are flat and are well placed without any major problem. The keyboard are comfortable and have enough space for the for number pad as well. The touch pad is smaller and could have been much larger. The touch pad is same color as wrist rest thus at times creating confusing. Even the right click and left click buttons and the not divided which another turn off.

Configuration

The Laptop comes with some basic configuration that you may easily find with the other manufacturer. However with Gateway you get bigger hard disk of 500GB along with the AMD E-350 CPU. The processor is not as fast as the new generation Intel processor. The computer is fast and helps you to do most of your work but can get slower with the multi tasking. However the Graphic card used is far better than the integrated Intel. AMD Radeon HD 6310 GPU is the new Fusion Platform laptop.

Performance and Battery Life

The performance of Gateway NV51B05u was impressive when played with some graphic games. The performance does not allow you to play some high end games but most of the games are play able. The HD video would stream with pleasing effect and that would allow you to make sure you get the best effects from the blue ray movies. The battery did run up to the expectation and lasted for more than 3 hr. Thanks to the battery efficient processors from AMD the battery has been lasting long, but I was wondering the battery could have stayed much longer than what it is right now as the Fusion platform has given a boot to the battery life and the expectation has gone much higher.

Input and Output

The input out put section took a hit when we could not discover USB 3.0 ports. The performance takes a hit as the USB 3.0 is the future of faster way transfer data. The speaker are average and much should not be expected from the monaural speaker as they are usually low on sound. 1,366x768 pixel which is common for the Low end laptop is just an common trend so there is not much we can talk about it. However the screen is bright enough for the day to day work but can pick

glare in presence of nearby light source.
