

Article published on February 20th 2012 | Software

Software outsourcing services delivered by offshore centers focuses on deliverables which can be done in least possible time. One needs skilled personnel on board who can handle problems with non-core operations especially the IT department. Third party providers are the ones who can offer decent work deliverables for a lesser cost for being competitive in the market. The time zone difference also helps them to deliver different tasks on a 24/7 basis. Recent market statistics reveal that the Indian market and other eastern countries are best suited offshore service destinations. Analysts predict a huge cash inflow and profits for upcoming service providers since the demand is very high.

Custom software development depends primarily on engineers and developers who are well versed in using the latest web technology. There are many web development companies who also provide web design and development solutions too. Most western countries have a serious time looking for resources in their local cities but the standard of living has forced them to look for options elsewhere since the local resources are not very cost-effective. Countries like UK and US follow a lucrative outsourcing policy wherein skilled technicians and developers from eastern offshore centers deliver the goods effectively. What's more, the offshore center also invests in the infrastructure that is required and works on more than one project to cover the costs. The changing approach has led many to look for better deals and lucrative contracts since it is a win-win situation for most companies. The change in strategy especially in engagement models involving onsite visits and offshore software development has also decreased the costs involved.

There are a lot of companies who offer testing, development and maintenance services. But not all web development providers can do justice to what they are assigned to. Consider this, according to the statistics mentioned in 2009, there were more than 40% of the Fortune 500 companies which included big-shot companies like Microsoft, General Electric, Oracle etc. favor custom software development since they find it lucrative and effective to counter the vagaries of recession. Most of the companies focus on extracting maximum work from low-cost areas like India, China and some other eastern countries. Most clients are also aware that the dropping costs amount in the range of 40%-70%. But one needs to be very particular while deciding on the offshore software development provider. India works out to be an ideal offshore software development center destination since the people there are well-versed with software development skills and are very much conversant with English.
