New Lasergrip Laser Sight for the Springfield XD and XDM Full Size Hand Gun is Now Available at Laser Sight Pro by [Nail Adil](#)

Article published on June 4th 2012 | [Sports](#)

Laser Sight Pro is please to announce the arrival of the new Crimson Trace laser grip for the Full Size Springfield XD and XDM. The new laser sight fits the Springfield Armory XD(M) 3.8, 4.5, 5.25 inch barrels. Previous to this laser grip, Crimson Trace had released a trigger guard mounted laser sight, the LG-448 Laserguard, which fit all models of the XD and XDM. Laserguards are activated by a squeeze button that lies underneath the trigger guard on the front of gun's grip when mounted to the gun. Laserguards are a great product, but when attached to the Springfield firearm, not all holsters will accommodate the laser sight. For gun owners who previous had a holster, this would mean buying a new holster the fits guns with lasers attached.

The new LG-487 laser grip incorporates Crimson Trace's industry-leading instinctive activation. The Springfield XD(M) has some of the most advanced safety features out of all the other pistols on the market. This firearm has a rear grip safety which doesn't allow the gun to fire unless compressed. The new LG-487 was flawlessly designed around this safety mechanism. This new laser sight attaches to the pistol by utilizing the replaceable backstrap feature of the XD(M) with a rear activation switch. The switch is instinctively activated as the pistol is held in a natural firing grip - all without compromising the grip safety of the weapon.

If anyone has heard of Crimson Trace's laser sight products, then the word "Instinctive Activation" was also most likely heard. This is the hallmark of the Crimson Trace brand. Instinctive Activation is the differentiating factor between Crimson Trace laser sights and other tactical lights in the industry. So what is it? Simply, when holding the gun in a normal firing grip, the laser is activated. There aren't any button switching to fumble around with. When the gun holster grips the pistol, the laser is on and pointing at the target.

Crimson Trace laser sights are also fully adjustable for windage and elevation. In Layman's terms, this means you can adjust the laser sight up and down, or left and right. CTC lasers factory-sighted at 50 feet, but it can be adjusted according to the gun owner's individual targeting needs. Also, many models include a master on/off switch "so that the laser sight can be completely powered down for training with iron sights.

In general, pistols, revolvers, and all handguns are compact firearms that can be difficult to aim effectively. Crimson Trace laser sights offer the advantage of helping shooters be more consistent and accurate. With more accuracy, shooters are more confident, which can ease tension in threatening scenarios. Even with law enforcement and military personnel, hours and hours of vigilant training can disappear in a flash if panic and confusion set in. Everyone can improve their shooting skills and confidence with the advanced technology of laser sights.
